2 clump_month_date

clump_month_date

Assign date for a given year & month

Description

This accepts a date, but changes the day. Set/degrade/clump all the days within a month to the same day.

Usage

```
clump_month_date(date_detailed, day_of_month = 15L)
```

Arguments

date_detailed The Date value containing the desired year and month. The day will be over-

written. Required

day_of_month The factor label assigned to the missing value. Defaults to 15.

Details

We use this frequently to set/degrade/clump all the days to the middle of their respective month (ie, the 15th day). The midpoint of a month is usually the most appropriate summary location. It makes graphs more intuitive. Using the midpoint of month can also avoid problems with timezones. A date won't get nudged to a neighboring month accidentally.

Value

An array of Date values.

Note

A stop error will be thrown if date_detailed is not a Date, or if day_of_month is not bounded by [1, 31]. Be careful that if you set a November date the 31st day, the result will be December 1st. Consequently, we recommend not setting the day to a value after the 28.

Author(s)

Will Beasley

Examples

```
library(OuhscMunge)
detailed <- seq.Date(from=as.Date("2011-04-21"), to=as.Date("2011-07-14"), by="day")
clumped <- clump_month_date(detailed)
table(clumped)
# 2011-04-15 2011-05-15 2011-06-15 2011-07-15
# 10 31 30 14</pre>
```

headstart_utilities 3

headstart_utilities

Utilities for outputting characteristics of a dataset used it code.

Description

These functions are used during the execution of a program. Rather they produce snippets that can be pasted into code, and help the developer avoid some typing.

Usage

```
column_rename_headstart( d, try_snake_case=TRUE )
column_class_headstart( d )
column_value_headstart( x )
```

Arguments

```
d A data.frame to describe.

try_snake_case If TRUE column names are attempted to be converted to snake_case.

x A vector to describe.
```

Value

Prints formatted code to the console.

Author(s)

Will Beasley

Examples

```
column_rename_headstart(datasets::OrchardSprays)
column_rename_headstart(datasets::iris)
column_class_headstart(datasets::OrchardSprays)
column_value_headstart(datasets::OrchardSprays$treatment)
```

match_statistics

Create explicit factor level for missing values.

Description

Missing values are converted to a factor level. This explicit assignment can reduce the chances that missing values are inadvertantly ignored. It also allows the presence of a missing to become a predictor in models.

4 match_statistics

Usage

```
match_statistics(d_parent, d_child, join_columns)
```

Arguments

d_parentd_childd_childA data.frame of the child table.

join_columns The character vector of the column names used to join to parent and child

tables.

Details

If a nonexistent column is passed to join_columns, an error will be thrown naming the violating column name.

More information about the 'parent' and 'child' terminology and concepts can be found in the Hierarchical Database Model Wikipedia entry, among many other sources.

Value

A numeric array of the following elements:

- parent_in_child The count of parent records found in the child table.
- parent_not_in_child The count of parent records *not* found in the child table.
- parent_na_any The count of parent records with a NA in at least one of the join columns.
- deadbeat_proportion The proportion of parent records *not* found in the child table.
- child_in_parent The count of child records found in the parent table.
- child_not_in_parent The count of child records *not* found in the parent table.
- child_na_any The proportion of child records *not* found in the parent table.
- orphan_proportion The count of child records with a NA in at least one of the join columns.

Note

The join_columns parameter is passed directly to dplyr::semi_join and dplyr::anti_join.

Author(s)

Will Beasley

Examples

OuhscMunge 5

```
ds_child <- data.frame(</pre>
             = 101:140,
 child_id
 parent_id
                   = c(4, 5, rep(6L:14L, each=4), 15, 16),
                   = rep(letters[3:12], each=4),
 letter
 index
                   = rep(1:2, each=2, length.out=40),
 dν
                   = runif(40),
 stringsAsFactors = FALSE
)
#Match on one column:
match_statistics(ds_parent, ds_child, join_columns="parent_id")
#Match on two columns:
match_statistics(ds_parent, ds_child, join_columns=c("letter", "index"))
```

OuhscMunge

Data manipulation operations frequently used in OUHSC BBMC projects. http://www.ouhsc.edu/bbmc/

Description

Thanks to Funders, including HRSA/ACF D89MC23154

OUHSC CCAN Independent Evaluation of the State of Oklahoma Competitive Maternal, Infant, and Early Childhood Home Visiting (MIECHV) Project., which evaluates MIECHV expansion and enhancement of Evidence-based Home Visitation programs in four Oklahoma counties.

Details

OuhscMunge.

Note

The release version will eventually be available through CRAN by running install.packages('OuhscMunge'). The most recent development version is available through GitHub by running devtools::install_github (repo = 'OuhscBbmc/OuhscMunge') (make sure devtools is already installed). If you're having trouble with the package, please install the development version. If this doesn't solve your problem, please create a new issue, or email Will.

Author(s)

William Howard Beasley, University of Oklahoma Health Sciences Center, College of Medicine, Dept of Pediatrics, BBMC.

Maintainer: Will Beasley <wibeasley@hotmail.com>

Examples

```
## Not run:
# Install/update REDCapR with the release version from CRAN.
install.packages('OuhscMunge') #But it's not on CRAN yet.

# Install/update REDCapR with the development version from GitHub
#install.packages('devtools') #Uncomment if `devtools` isn't installed already.
devtools::install_github('OuhscBbmc/OuhscMunge')

## End(Not run)
```

replace_nas_with_explicit

Create explicit factor level for missing values.

Description

Missing values are converted to a factor level. This explicit assignment can reduce the chances that missing values are inadvertantly ignored. It also allows the presence of a missing to become a predictor in models.

Usage

```
replace_nas_with_explicit(scores, new_na_label = "Unknown",
    create_factor = FALSE, add_unknown_level = FALSE)
```

Arguments

scores An array of values, ideally either factor or character. Required

new_na_label The factor label assigned to the missing value. Defaults to Unknown.

create_factor Converts scores into a factor, if it isn't one already. Defaults to FALSE.

add_unknown_level

Should a new factor level be created? (Specify TRUE if it already exists.) Defaults to FALSE.

Value

An array of values, where the NA values are now a factor level, with the label specified by the new_na_label value.

Note

The create_factor parameter is respected only if scores isn't already a factor. Otherwise, levels without any values would be lost.

A stop error will be thrown if the operation fails to convert all the NA values.

replace_with_nas 7

Author(s)

Will Beasley

Examples

```
library(OuhscMunge) #Load the package into the current R session.
missing_indices <- c(3, 6, 8, 25)
# With a character variable:
a <- letters
a[missing_indices] <- NA_character_
a <- OuhscMunge::replace_nas_with_explicit(a)

# With a factor variable:
b <- factor(letters, levels=letters)
b[missing_indices] <- NA_character_
b <- OuhscMunge::replace_nas_with_explicit(b, add_unknown_level=TRUE)</pre>
```

replace_with_nas

Convert blank, zero-length values to NAs for a variety of data types.

Description

Elements of zero-length are converted to NAs. Can force cohersion to an optionally-specified data type.

Usage

```
replace_with_nas(x, return_type = NULL)
```

Arguments

x An array of values. Required return_type Data type of returned vector. Optional

Details

If return_type is missing, returned data type will match input. Supports cohersion to integer, numeric, character, logical, and Date vectors.

If return_type=logical, a logical vector will be returned if x contains only blanks and the characters "0" and "1".

Value

An array of values with NAs.

Note

Contact the package author if you'd like the function generalized so that additional values (other that "") are converted to NAs.

8 snake_case

Author(s)

Will Beasley

Examples

```
library(OuhscMunge) #Load the package into the current R session.
replace_with_nas(c("a", "b", "", "d", ""))
replace_with_nas(c("a", "b", "", "d", ""), return_type="character")

replace_with_nas(c(1, 2, "", "", 5), return_type="character")
replace_with_nas(c(1, 2, "", "", 5)) #Equivalent to previous line.
replace_with_nas(c(1, 2, "", "", 5), return_type="integer")
replace_with_nas(c(1, 2, "", "", 5), return_type="numeric")

replace_with_nas(c("2011-02-03", "", "", "2011-02-24"), return_type="Date")
replace_with_nas(c("T", "", "", "F", "FALSE", "", "TRUE"), return_type="logical")
replace_with_nas(c("1", "", "", "", "0", "0", "", "1") , return_type="logical")
```

snake_case

Convert variable names to snake_case

Description

This function attempts to convert variables to snake_case, even if it's already in snake_case. The important regex lines were posted by Stack Overflow user epost in "Elegant Python function to convert CamelCase to snake_case?".

Usage

```
snake_case(x)
```

Arguments

х

A vector to of names to convert.

Value

A vector of converted names.

Author(s)

Will Beasley

Examples

```
snake_case(colnames(datasets::OrchardSprays))
snake_case(colnames(datasets::iris))
```
